Introduction

EVRH high pressure range is a direct or servo operated solenoid valve specially designed to meet the requirements for high pressure refrigerants as R410A and R744 (CO₂). The EVRH valve can be used for liquid, suction and hot gas lines

Features

- Normally closed
- Wide choice of coils for a.c. and d.c. voltage
- Suitable for R410A and R744 (CO₂)
- Designed for media temperatures up to +105°C / 221°F
- Design pressure 45.2 barg / 655 psig
- MOPD up to 38 bar / 550 psi with 20 watt coil
- Solder connection up to 7/8 inch
- Extended ends for soldering
- It is not necessary to dismantle the valve during soldering.

Approvals

The Low Voltage Directive (LVD) 73/23/EC with amendments EN 60730-2-8.

Technical data
SI unit

Type	Opening differential pressure with standard coil Δp bar					k_v value ¹⁾ m ³ /h	Temperature of medium	Refrigerant	Max. working pressure PB
	Max. (MOPD liquid ²⁾)								
	Min.	10 w.a.c.	12 w.a.c.	20 w.a.c.	20 w.d.c.				
EVR 2	0.0	25	25	38	18	0.16	-40°C → +105°C for 10 or 12 w coil Max. 130°C during defrost	R410A R744 (CO ₂) HCFC HFC	45.2 barg
EVR 3	0.0	21	25	38	18	0.27			
EVR 6	0.05	21	25	38	18	0.8			
EVRH 10	0.05	21	25	38	18	1.9	-40°C → 80°C for 20 watt coil		
EVRH 15	0.05	21	25	38	18	2.6

EVRH 10	30.8	43.5	53.2	61.5	68.9
EVRH 15	42.1	59.5	72.8	84.2	94.1
EVRH 20	81.0	114.5	140.0	162	181.0

Capacities are based on:

 Liquid temperature $t_l = +25^\circ\text{C}$ ahead of the valve

 Evaporating temperature $t_e = -10^\circ\text{C}$

Superheat 0 K

Correction factors

 When sizing valves, the plant capacity must be multiplied by a correction factor depending on liquid temperature t_l ahead of the valve/evaporator. When the corrected capacity is known, the selection can be made from the table.

Capacities are based on liquid temperature $t_l = +25^\circ\text{C}$ ahead of evaporator.

The table values refer to the evaporator capacity and are given as a function of evaporating temperature t_e and pressure drop Δp across the valve.

Capacities are based on dry, saturated vapour ahead of the valve.

During operation with superheated vapour ahead of the valve, the capacities are reduced by 4% for each 10 K superheat

Correction factors

When sizing valves, the evaporator capacity must be multiplied by a correction factor depending on liquid temperature t_l ahead of expansion valve.

When the corrected capacity is known, the selection can be made from the table

	1.6	67.8	69.5	70.0	68.4	63.8

An increase in hot gas temperature t_h of 10 K, based on $t_h = t_c + 25^\circ\text{C}$ reduces valve capacity approx. 2% and vice versa.

A change in evaporating temperature t_e changes valve capacity: see correction factor table below.

Correction factors

When sizing valves, the table value must be multiplied by a correction factor depending on evaporating temperature t_e .

Correction factors for liquid temperature t_l

t_l °C	-40	-30	-20	-10	0	+10
R410A	0.92	0.95	0.98	1.0	1.02	1.03

An increase in hot gas temperature t_h of 10 K reduces valve capacity approx 2% and vice versa.

	25	20.8	21.6	20.1

Correction factors for t_h and t_c

The table values refer to hot gas capacity and are given as a function of condensing temperature t_c and pressure drop Δp across the valve.

Capacities are based on a hot gas temperature superheated 40°F above condensing temperature (t_h = t_c + 40°F).

For each additional 10°F of superheat above 40°F, the table capacities must be reduced by 1%.

When the valve is used in a hot gas defrost circuit, evaporator temperature affects the capacity.

When the evaporator temperature differs from +40°F, adjust the table capacities by multiplying them by the appropriate correction factor found in the following table.

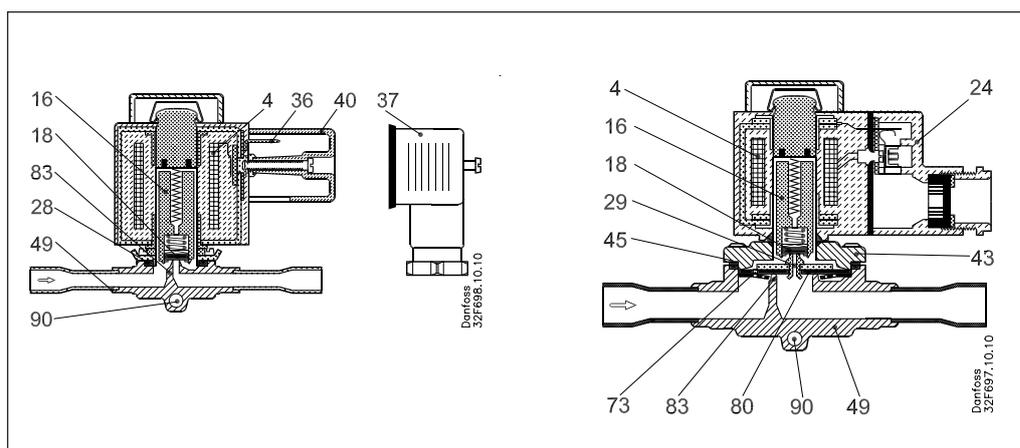

t _e °F	-40	-20	0	20	40	50
Factor	1.18	1.14	1.09	1.04	1	0.97

Capacity R744 (CO₂)

Due to the fact that EVRH only can be used for sub critical CO₂ application, capacity tables are not illustrated in this catalog. For capacity dimension please refer to DIR-Calc or contact your local Danfoss office.

Design/ Function

- 4. Coil
- 16. Armature
- 18. Valve plate/ Pilot valve plate
- 20. Earth terminal
- 24. Connection for flexible steel hose

- 43. Valve cover
- 45. Valve cover gasket
- 49. Valve body
- 73. Equalization hole
- 80. Diaphragm/ Servo piston
- 83. Valve seat
- 90. Mounting hole

EVRH solenoid valves are designed on two different principles:

1. Direct operation
2. Servo operation

1. Direct operation

EVR2 and 3 are direct operated. The valve opens direct for full flow when the armature (16) moves up into the magnetic field of the coil.

This means that the valve operates with a min. differential pressure of 0 bar.

The teflon valve plate (18) is fitted direct on the armature (16).

Inlet pressure acts from above on the armature and the valve plate. Thus inlet pressure, spring force and the weight of armature act to close the valve when the coil is currentless.

2. Servo operation

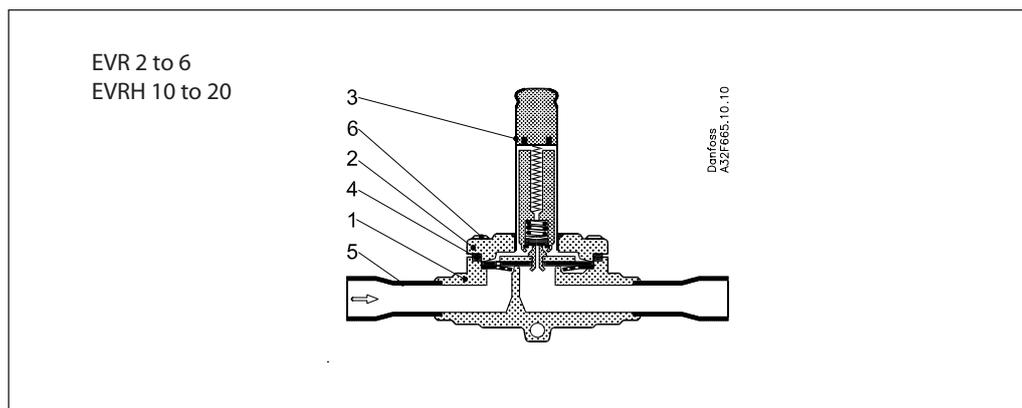

EVR 6 and EVRH 10-20 are servo operated with a "floating" diaphragm (80). The pilot orifice (29) of stainless steel is placed in the centre of the diaphragm. The teflon pilot valve plate (18) is

fitted direct to the armature (16). When the coil is currentless, the main orifice and pilot orifice are closed. The pilot orifice and main orifice are held closed by the weight of the armature, the armature spring force and the differential pressure between inlet and outlet sides.

When current is applied to the coil the armature is drawn up into the magnetic field and opens the pilot orifice. This relieves the pressure above the diaphragm i.e. the space above the diaphragm becomes connected to the outlet side of the valve. The differential pressure between inlet and outlet sides then presses the diaphragm away from the main orifice and opens it for full flow. Therefore a certain minimum differential pressure is necessary to open the valve and keep it open. For EVR 6 and EVRH 10 to 20 valves this differential pressure is 0.05 bar.

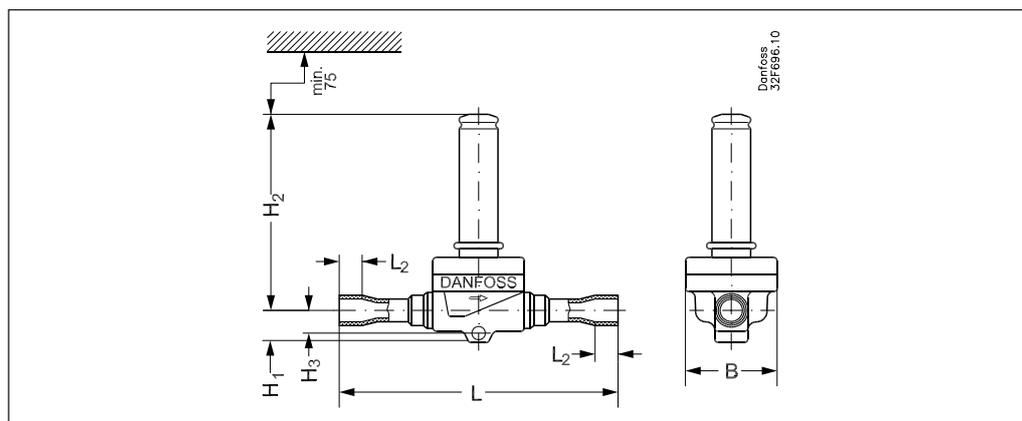

When current is switched off, the pilot orifice closes. Via the equalization holes (73) in the diaphragm, the pressure above the diaphragm then rises to the same value as the inlet pressure and the diaphragm closes the main orifice.
